

EZWeb – Web-Based ACH Payments

EZWeb allows Merchants and Bill Pay processors to receive customer-initiated ACH payments from their website or shopping cart.

Benefits – Since the payment is initiated by the consumer at the merchant’s website, merchants are able to receive ach payments at any time from any U.S.-based DDA account.

- *Improves profitability by saving on costly invoice processing – paper, envelopes, postage, and the labor to put it all together*
- *Ensures predictable cash flow – no waiting for mailed in payments*
- *Increases productivity through streamlined operations*
- *Heightens customer retention and satisfaction*
- *Reduces or eliminates check deposit and returned check fees.*
- *Online reporting allows for easy updates and reconciliation.*

How It Works

Using the eProcessingNetwork gateway or by directly connecting, merchants enable their website to receive ACH payments by either collecting consumer data on their own hosted payments page or transparently rolling consumers over to the eProcessingNetwork payment page for completing an ACH payment. Customers simply enter the information off of the face of their check and dollar amount to submit the transaction via the secure online interface.

Online monitoring and reporting systems give users the tools needed to effectively manage accounts receivable records and provide needed flexibility to accommodate customer needs.

Unique Features

Two Payment Hosting Options – the eProcessingNetwork gateway allows merchants to collect consumer data on their website and forward to the gateway or to use a simple link to transfer consumers to the gateway to complete payment.

Returns Re-initiation – Transactions that return for Non-Sufficient Funds are eligible for additional representment via the ACH system.
